## PRODUCT DESCRIPTION

The anti sniper Optical Detector is capable of detecting various passive optical and electrooptical devices such as binoculars, night vision devices, weapon sites, range poles, datum optical markers and leveling rods equipped with optical reflectors. Utilizing an eye- safe laser scanner, this advanced device detects lenses and reflectors in its line of site even if these objects are obstructed by bushes, windows or windshields. It may be used to provide security for high security zones and VIPs.

A detector may be hand-held or mounted on a tripod. An operator examines the area, and when an optical reflector of any kind is detected, its position is marked with a red dot visible through the viewfinder of the Optical Detector. For added convenience, an audio signal can be activated, the detected object's distance from the detector is then measured, displayed, or transferred via audio signal.

The detector has two modes of operation: long range field mode and detailed city mode. Additional viewfinder lighting can be activated at low light. It may be combined with night vision, thermal and other observational devices with the help of a picatinny mount.
